

# Trends and Issues in Renewable Energy

## School of the Coast and Environment Spring 2007 Seminar Series

May 4, 2007

David E. Dismukes  
Center for Energy Studies  
Louisiana State University

# **Overview of Alternative Energy Generation**

# Types of Alternative Energy Generation

US DOE

US DOE

Hydroelectric

US DOE

Biomass / Biogas

Wave Energy

Geothermal

lbl.gov

US DOE

Wind

lbl.gov

US DOE

Solar

## Renewable Energy Technologies

Renewable Energy Source	Generation Technology
Solar	Photovoltaic Thermal Energy Capture
Wind	Wind Turbines
Water	Hydroelectric Turbines
Ocean	Wave Energy Devices Tidal/Current Energy Turbines Thermal Energy Conversion
Geothermal	Steam Turbines Direct Use Geothermal Heat Pumps
Biomass	Combustion (direct fired, co-firing with coal) Gasification / Pyrolysis
Biogas	Engine generators Combustion turbines Microturbines Fuel cells

**Renewable energy has fallen as a share of total U.S. power generation.**

## Non-hydroelectric Renewable Electricity Generation as a Share of Total US

**Non-hydroelectric renewable energy has increased as a share of total U.S. power generation.**

**Current trends in renewable energy have been flat over the past several years and dominated by hydroelectric generation.**

# Alternative Generation as a Share of US Total, 2005

## Non-hydroelectric Renewable Electricity Generation as a Share of Total US

**Wind energy is rapidly become the renewable energy resource of choice at the margin.**

**California leads the nation in renewable energy primarily because of its large geothermal resource.**

Note: This excludes conventional hydroelectric generation.  
 Source: Energy Information Administration, US Department of Energy

## National Average Levelized Generation Costs for New Plants

**In market driven energy markets, costs drive technology development and implementation.**

# Projected Alternative Energy Generation

Alternative energy is expected to increase significantly in the next 25 years.  
 Solar leads on percentage basis; wind leads on absolute basis.

## Projected Alternative Energy Costs, in 2003 Dollars

**Costs are anticipated to fall considerably over the next several years as implementation increases.**

Technology	Size (MW)	Levelized COE (cents/kWh)			
		2005	2008	2010	2017
Wind	75	4.1	3.4	3.3	2.7
Geothermal	50	5.3	5	4.9	4.5
Biomass	20	6.6	6.2	6.2	5.7
Solar PV	0.25	27.5	22.9	21.1	15.6

**The key driver for renewable energy is installed costs (up-front capital investment), since fuel costs are close to zero.**

	Low Investment Costs (\$/kW)		High Investment Costs (\$/kW)		Low Generation Costs (\$/kW)		High Generation Costs (\$/kW)	
	2002	2010	2002	2010	2002	2010	2002	2010
Small Hydro Power	\$ 1,000	\$ 950	\$ 5,000	\$ 4,500	\$ 2-3	\$ 2	\$ 9-15	\$ 8-13
Solar Photovoltaic Power	\$ 4,500	\$ 3,000	\$ 7,000	\$ 4,500	\$ 18-20	\$ 10-15	\$ 25-80	\$ 18-40
Concentrating Solar Power	\$ 3,000	\$ 2,000	\$ 5,000	\$ 4,000	\$ 10-15	\$ 6-8	\$ 20-25	\$ 10-12
Biopower	\$ 500	\$ 400	\$ 4,000	\$ 3,000	\$ 2-3	\$ 2	\$ 10-15	\$ 8-12
Geothermal Power	\$ 1,200	\$ 1,000	\$ 5,000	\$ 3,500	\$ 2-5	\$ 2-3	\$ 6-12	\$ 5-10
Wind Power	\$ 850	\$ 700	\$ 1,700	\$ 1,300	\$ 3-5	\$ 2-4	\$ 10-12	\$ 6-9

Note: Discount rate is 6 percent for all technologies; amortization period is 15-25 years, and operation and maintenance costs are technology-specific.

Source: International Energy Agency

# Factors Driving Alternative Energy Development

- High Fossil Fuel Prices

- Energy Security

- Climate Change

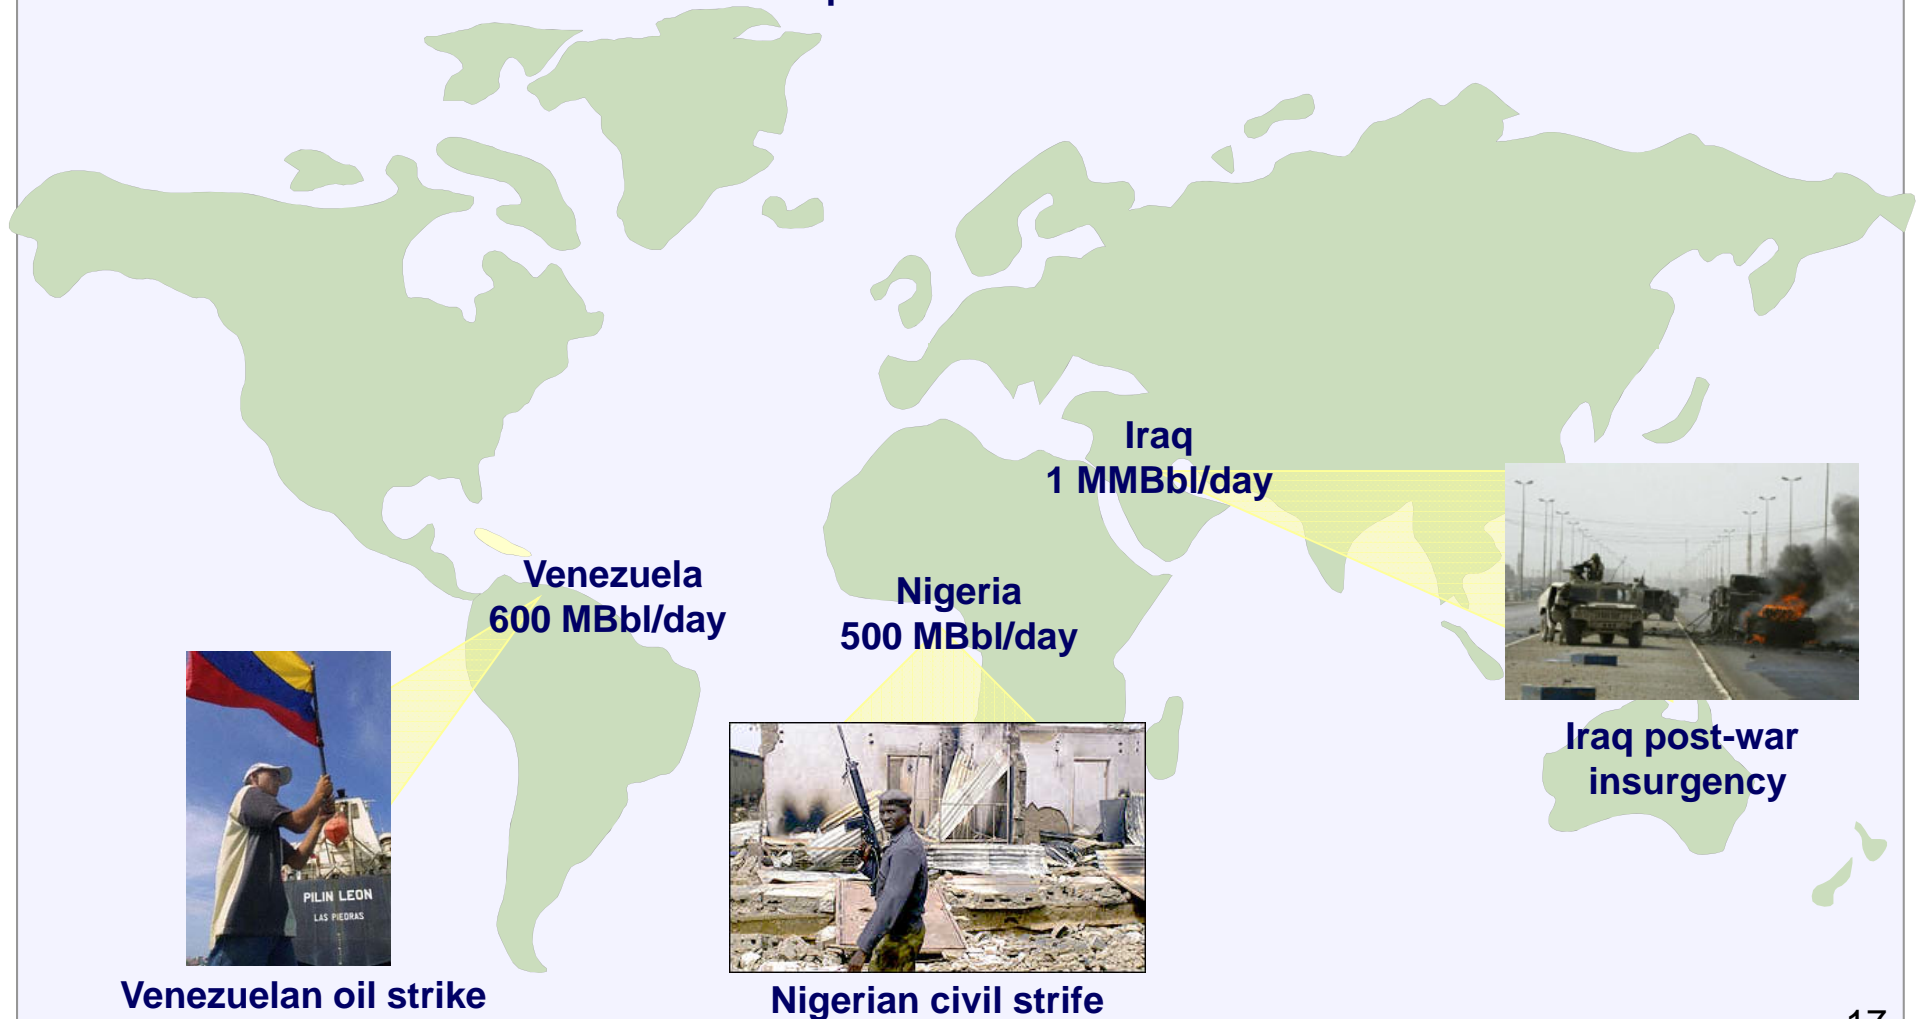

**Rapid fossil fuel increases have created favorable economics for renewable resources.**

## Impact of Shut-in Production Worldwide

Total of Potential from Shut-in Production: 2.1 MMBbl/d  
Forecast World Consumption Growth for 2006: 1.6 MMBbl/d  
Forecast World Consumption Growth for 2007: 1.8 MMBbl/d

**Carbon dioxide emissions in the power industry alone have increased 22 percent since 1994.**

Note: includes emissions from conventional power plants and combined-heat-and-power plants.

Source: Energy Information Administration, US Department of Energy

Recent activities have dramatically shifted the outlook for power generation.

### IPCC Report

- An international network of climate change scientists has concluded for the first time that global warming is "unequivocal" and that human activity is the main driver, "very likely" causing most of the rise in temperatures since 1950.

### Supreme Court Decision

#### *Commonwealth of Massachusetts et al. v. Environmental Protection Agency et al.*

- Issue: is carbon dioxide a pollutant that should be regulated by the EPA
- The EPA argued that carbon dioxide is not a pollutant; it does not have the authority to regulate
- The Court ruled that the Clean Air Act gives the Environmental Protection Agency the authority to regulate the emissions of carbon dioxide and other greenhouse gases from cars.

### D.C. Circuit Court

#### *Coke Oven Environmental Taskforce v. Environmental Protection Agency et al*

- The EPA has failed to regulate carbon dioxide from new coal-fired power plants
- Likely to be influenced by Massachusetts Supreme Court decision.

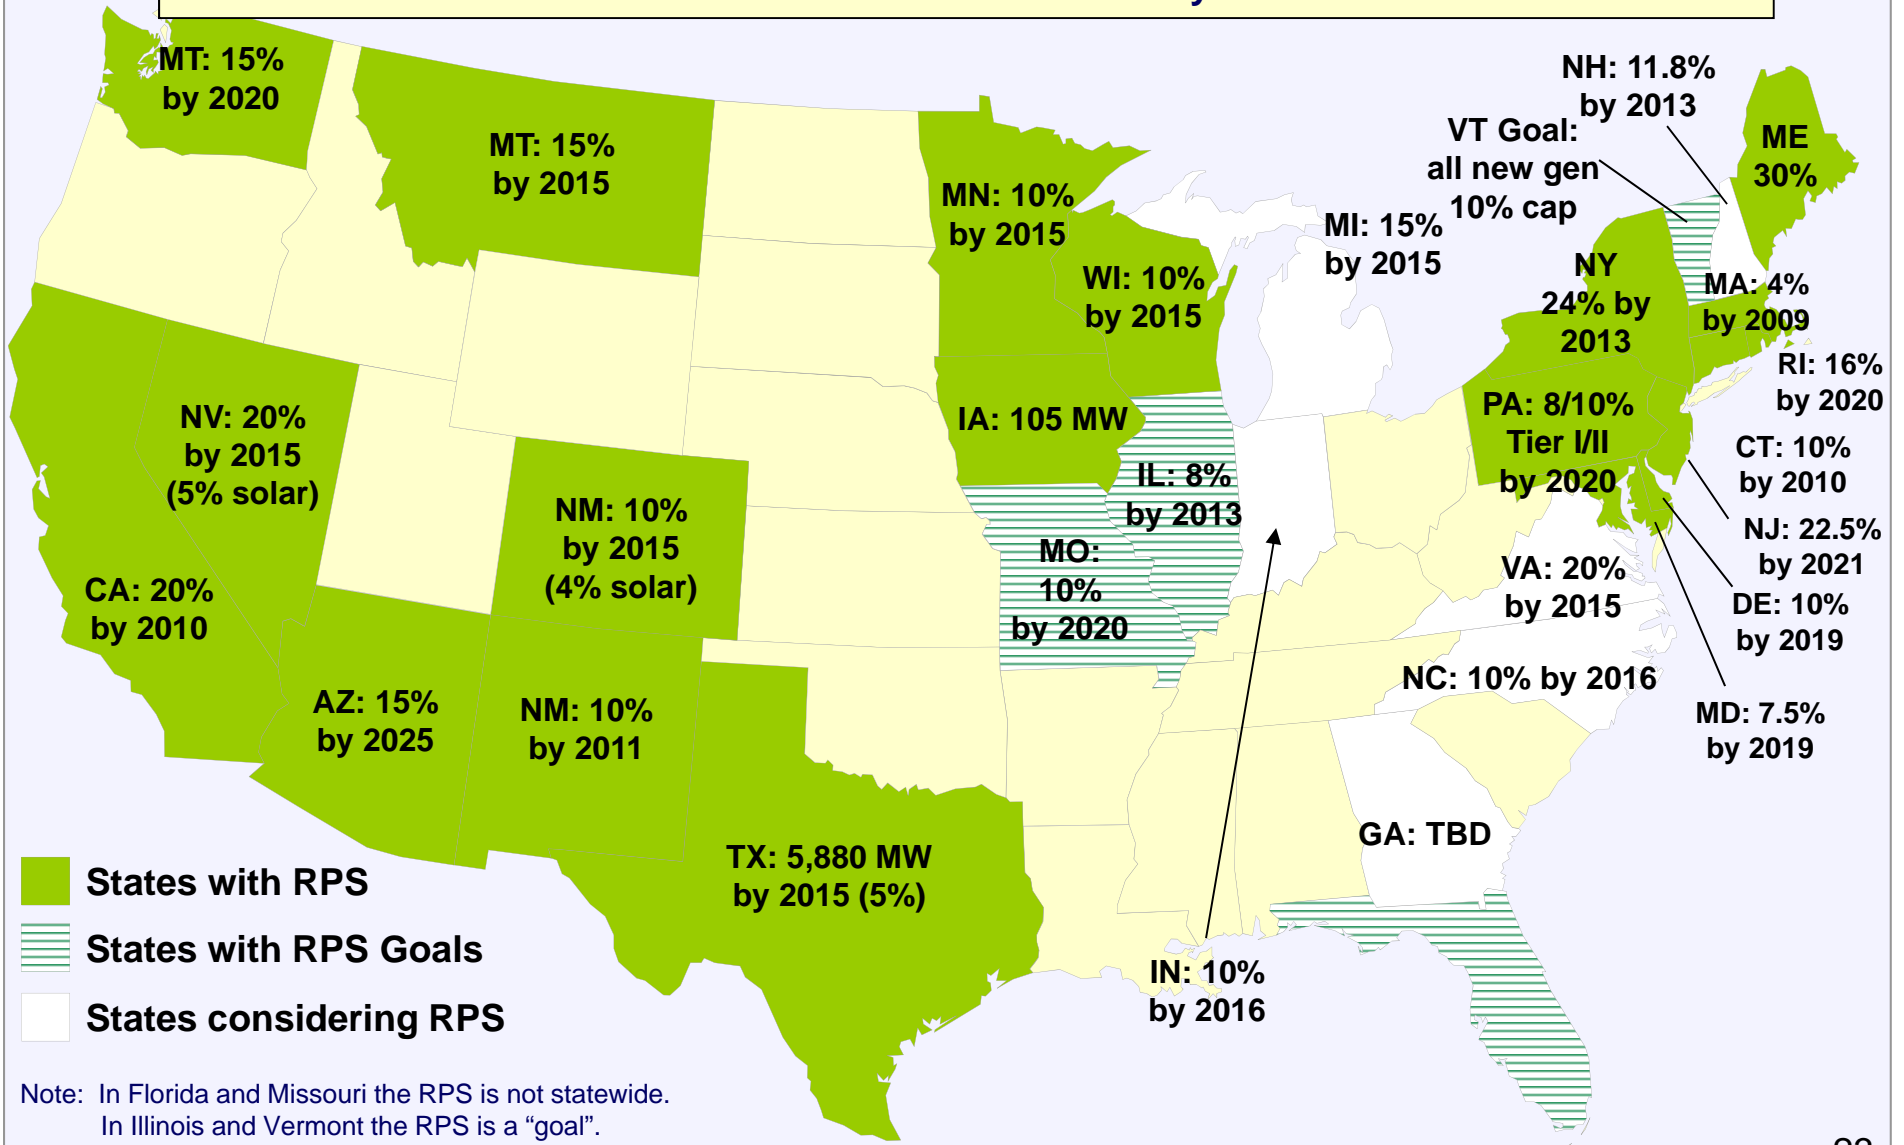

- **Voluntary Markets for Alternative Energy:** renewable energy attributes are now assigned property rights and can be traded.
- **Power System Bypass:** interesting getting off the grid.
- **Federal Tax Credits:** several statutes offering tax incentives.
- **Renewable Portfolio Standards:** state-level renewable generation mandates.

**Policy Mechanisms  
for Alternative Energy**

**A renewable portfolio standard (RPS) is a state policy that requires electricity providers to obtain a minimum percentage of their power from renewable energy resources by a certain date.**

# States with Renewable Portfolio Standards

Currently there are 20 states that have RPS policies in place. Together these states account for more than 42% of the electricity sales in the US.

Note: In Florida and Missouri the RPS is not statewide.  
 In Illinois and Vermont the RPS is a "goal".

Source: Database of State Incentives for Renewable Energy, Interstate Renewable Energy Council.

## Anticipated Generation from RPS Adopting States by 2025

RPS Mandated Generation  
as a Share of Generation  
in RPS States

RPS Mandated Generation  
as a Share of Total US  
Generation

Note: assumes generation growth of 1 percent per year in each state.  
Source: Energy Information Administration, US Department of Energy

“Renewable Energy Certificates” (RECs), also known as “green tags” or “Tradable Renewable Certificates” (TRCs), are the property rights to the environmental benefits from generating electric from renewable energy sources.

These certificates can be sold and traded and the owner of the REC can legally claim to have purchased renewable energy.

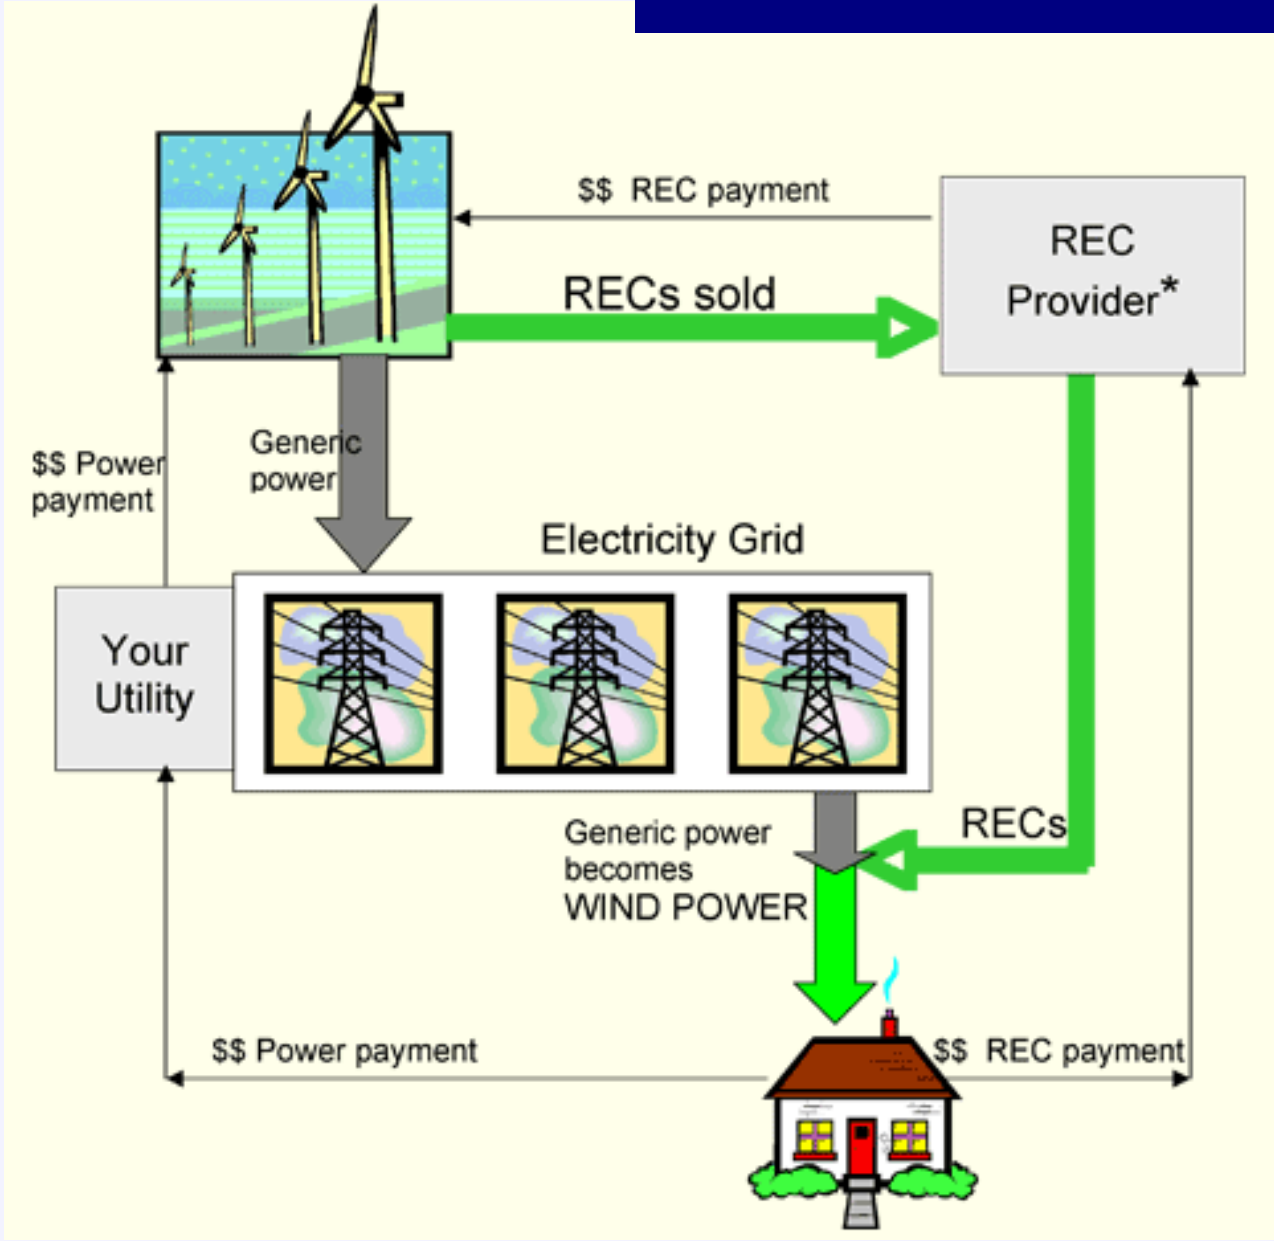

Thought of as “market-based” approach to promoting renewable energy.

# How RECs Change the Nature of "Green Transactions"

A REC creates a financial approach to facilitating renewable energy that can be distinctly different than the actual physical nature of how power is generated.

# Wholesale REC Transactions

Incentive	Description
<b>Corporate Depreciation</b>	<ul style="list-style-type: none"><li>• Modified Accelerated Cost-Recovery System</li></ul>

<b>23. Internal Rate of Return</b>	<b>24.5%</b>														

Internal rates of return changed considerably

Note: Assumes a 100kW unit with a 15% capacity factor and capital cost of \$6,710/kW.

# Alternative Energy Stocks vs. Russell 2000 and S&P 500

Wall Street is certainly placing increasing value on alternative energy.

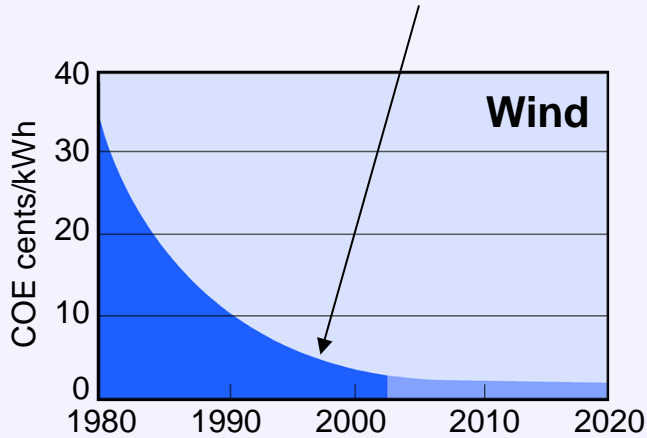

**Ongoing Challenges  
for Alternative Energy Development**

- **Cost Issues:** what will be the nature of ongoing cost trends in light of past performance.
- **Dispatch / Availability Issues:** Ongoing challenges for renewable energy for both short term dispatch and long term planning.
- **REC Property Right Issues:** Who owns environmental attributes of existing resources contracted to utilities.
- **Regulatory / Contracting Issues:** What role does regulatory uncertainty play in the process.
- **Regional Technical Capabilities:** National markets are efficient, but lead to regional winners and losers.

# Renewable Energy Cost Trends

**Will government support and policies reduce incentives to maintain cost efficiency trends**

**Levelized cents/kWh in constant \$2000<sup>1</sup>**

### Capacity Valuation

- Intermittent nature can create value/planning problem for meeting peak load.
- Can lead to less than socially optimal level of renewable resources.

---

### Imbalance

- Wind resources have difficult time meeting most imbalance standards in wholesale markets/regional security coordination.
- FERC attempting to hold to +/- 10 percent standard. Penalties for not meeting standards.
- Can impact overall project economics or can have impact on market/system operations.

- RPS is forcing states to address REC ownership questions
- Uncertainty about ownership limits REC marketability
  - Critical for QF contracts – quantity and value of RECs is significant
  - Behind-the-meter projects are also eligible for RPS – if ownership not clarified, will lead to double claims
- State policy-makers are key to determining ownership
  - FERC QF ruling still subject to differing interpretations
  - Need to watch (or participate in) state regulatory proceedings
  - State legislative action may reduce appeals and uncertainty

### Rate Impacts

- Large scale implementation.
- Costs of set-asides.
- Costs of special interests.

---

### Long Term Contracting

- Some states are finding RPS alone is not enough since many have sunset provisions creating regulatory uncertainty.
  - Claims that financial community demands more certainty for favorable financing.
-

Wind

- Resources are limited
- Intermittency affects cost and value

Biomass

- Cost reductions can “borrow” from allied technologies (coal, IGCC, combined cycle)

Municipal Waste/  
Landfill Gas

- Resources are very limited
- Site specific

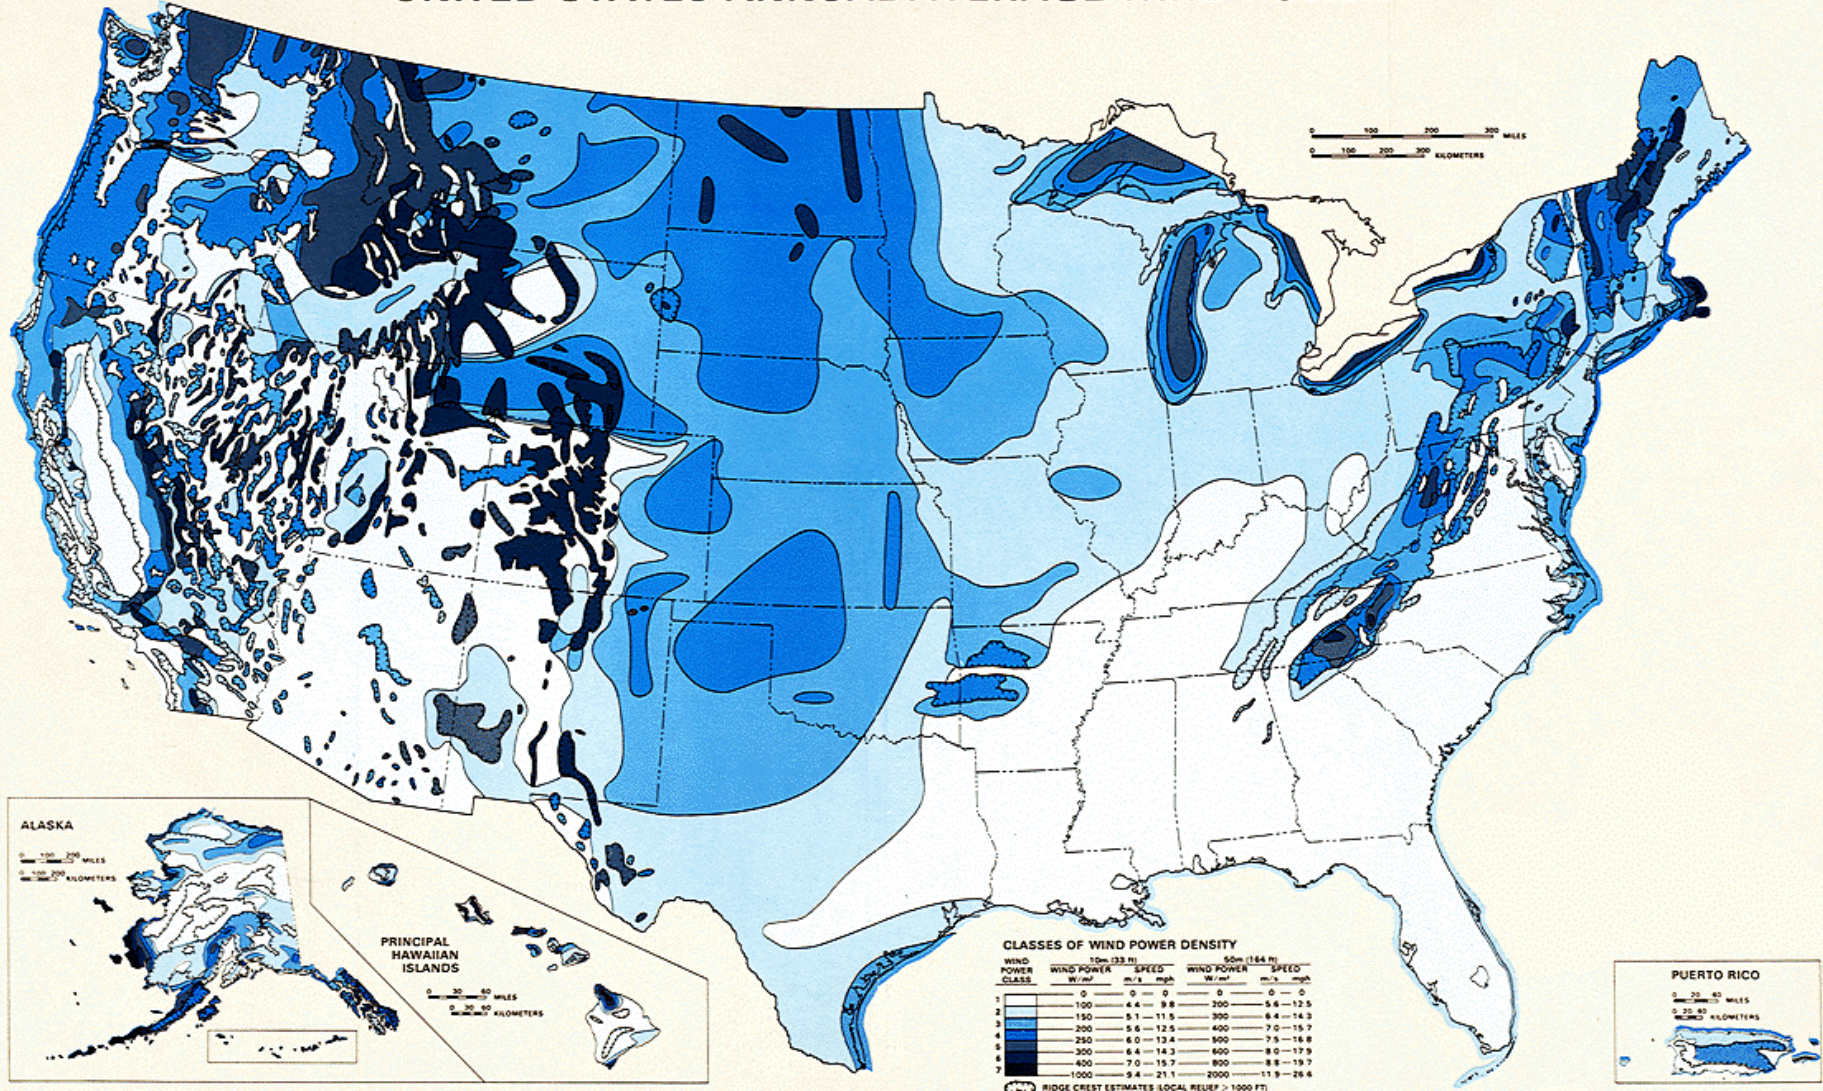

Solar

- Lowest cost installation will be on new construction
- Despite increasing competition, technology is expected to remain too competitive for widespread adoption

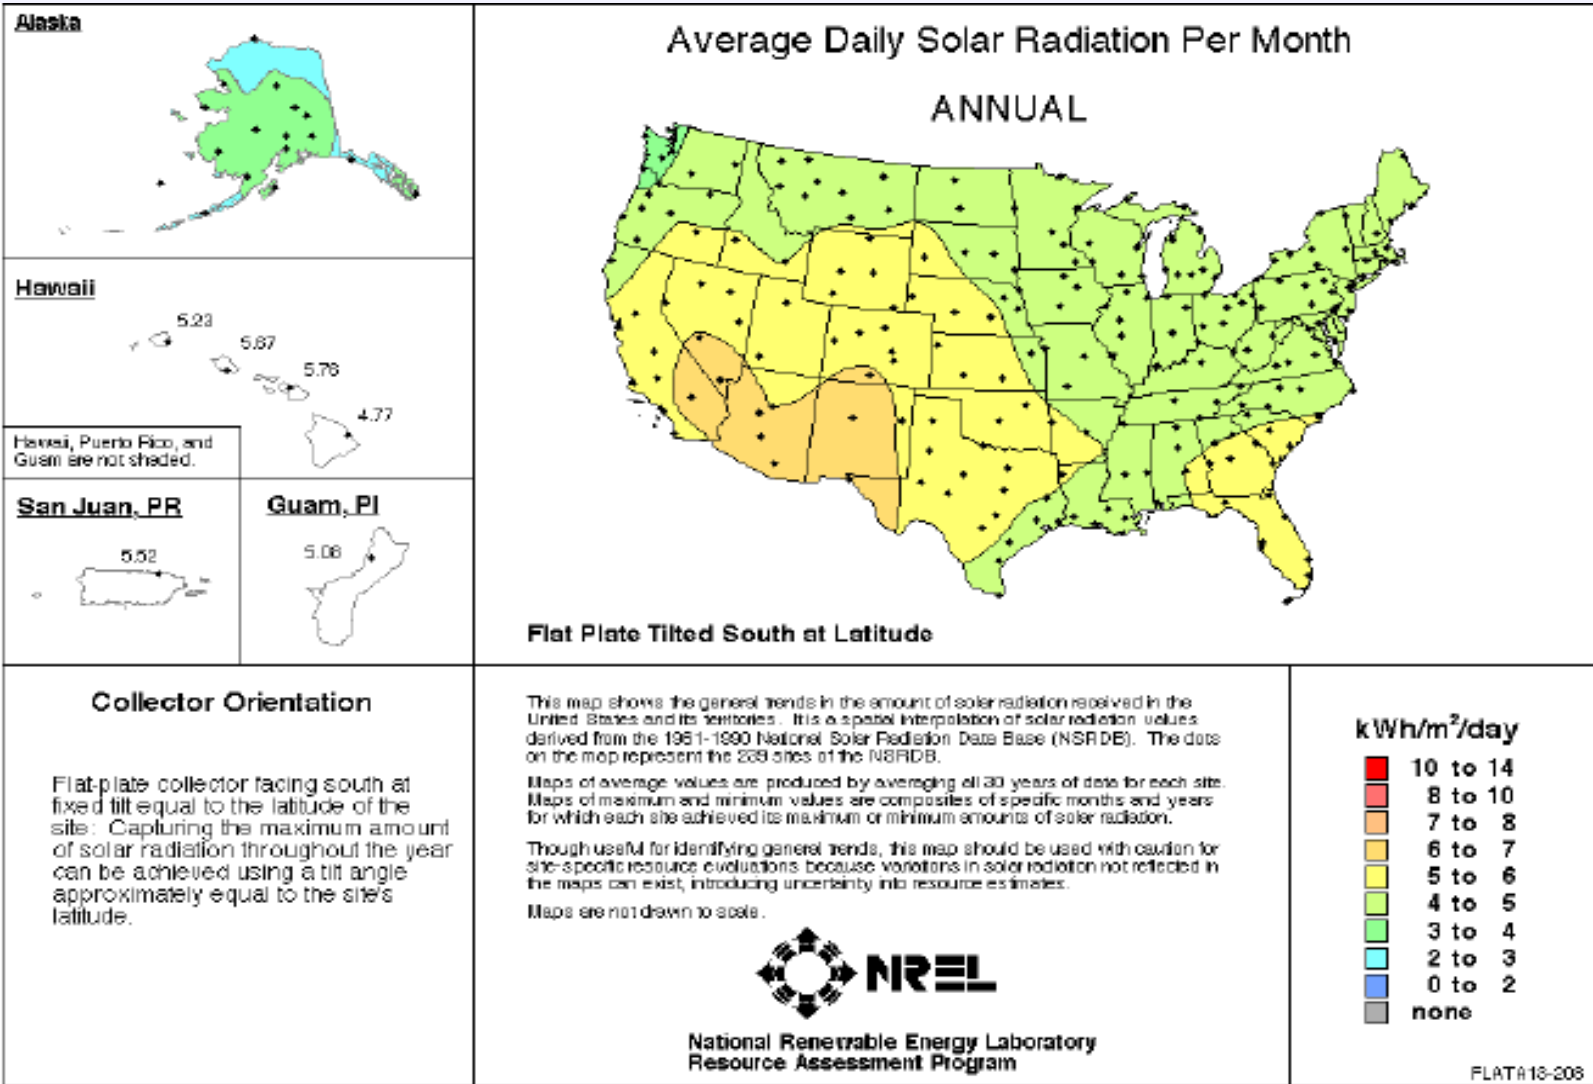

# Technical Challenges -- Wind Resources

UNITED STATES ANNUAL AVERAGE WIND POWER

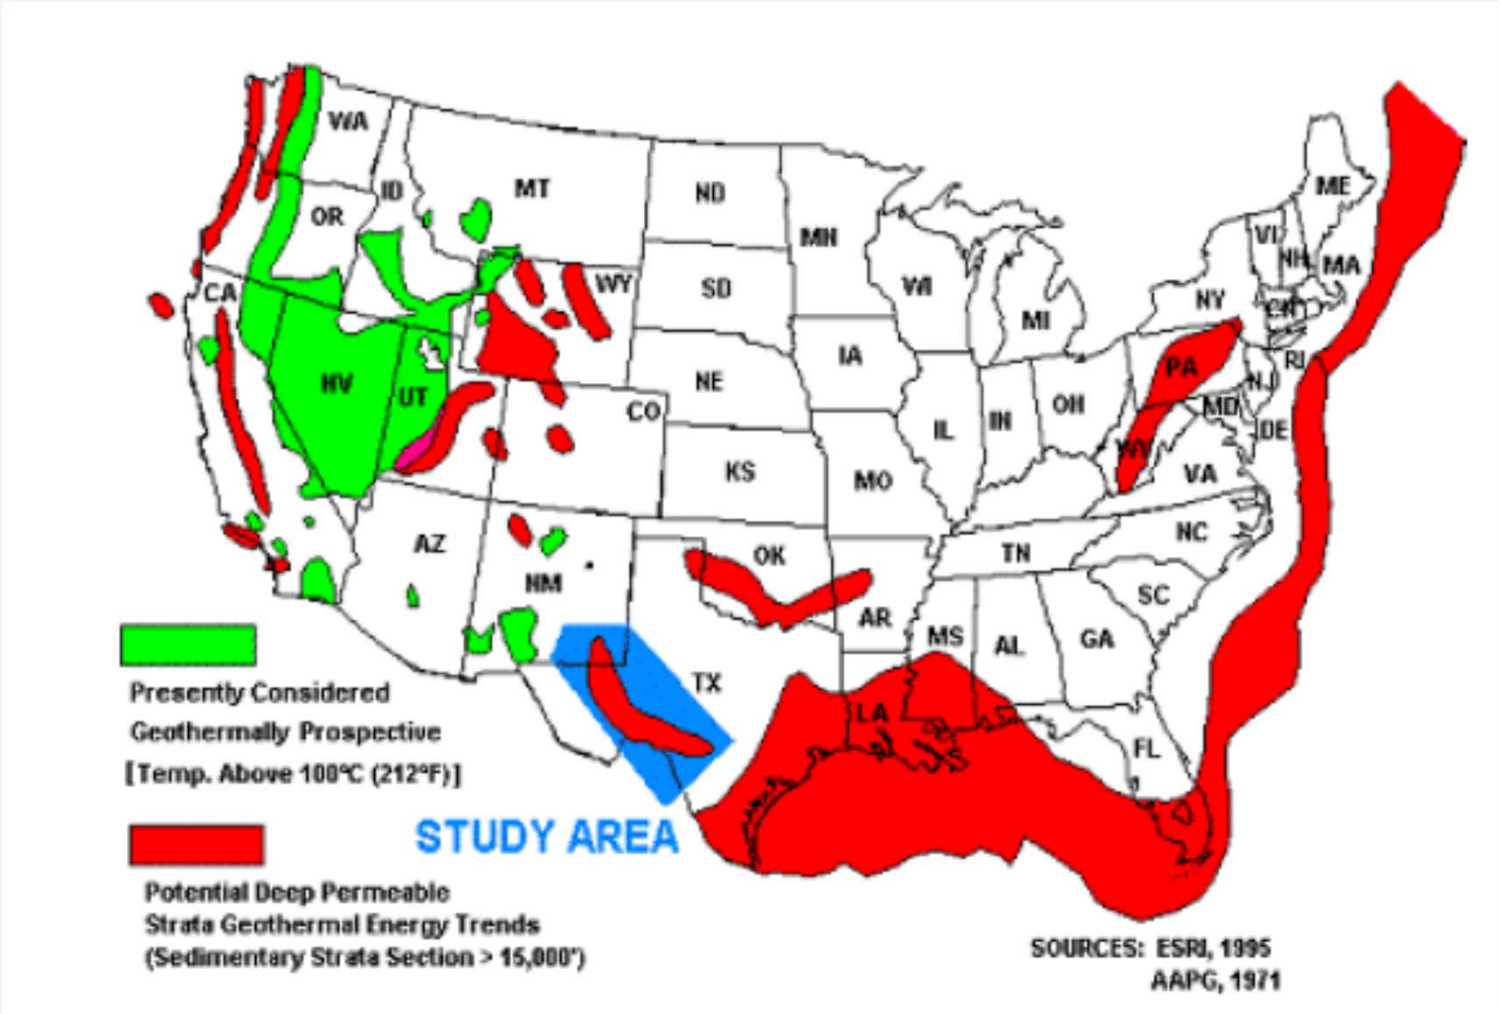

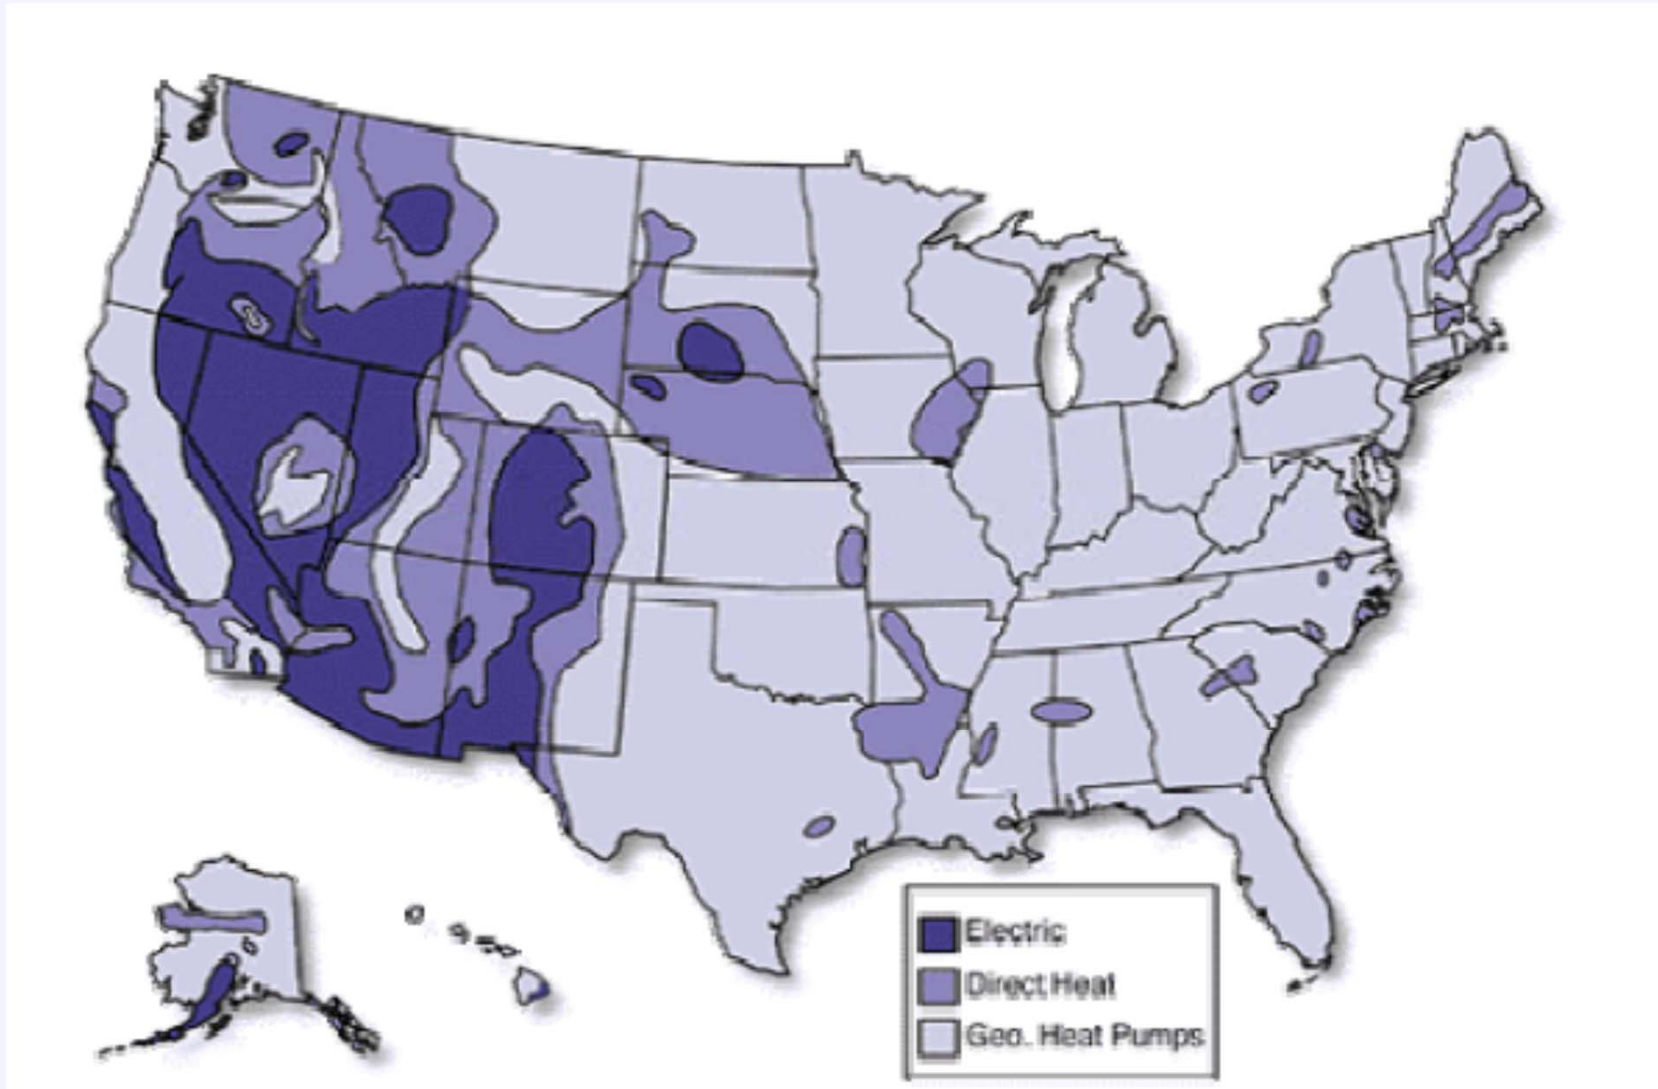

# Technical Challenges -- Solar Resources

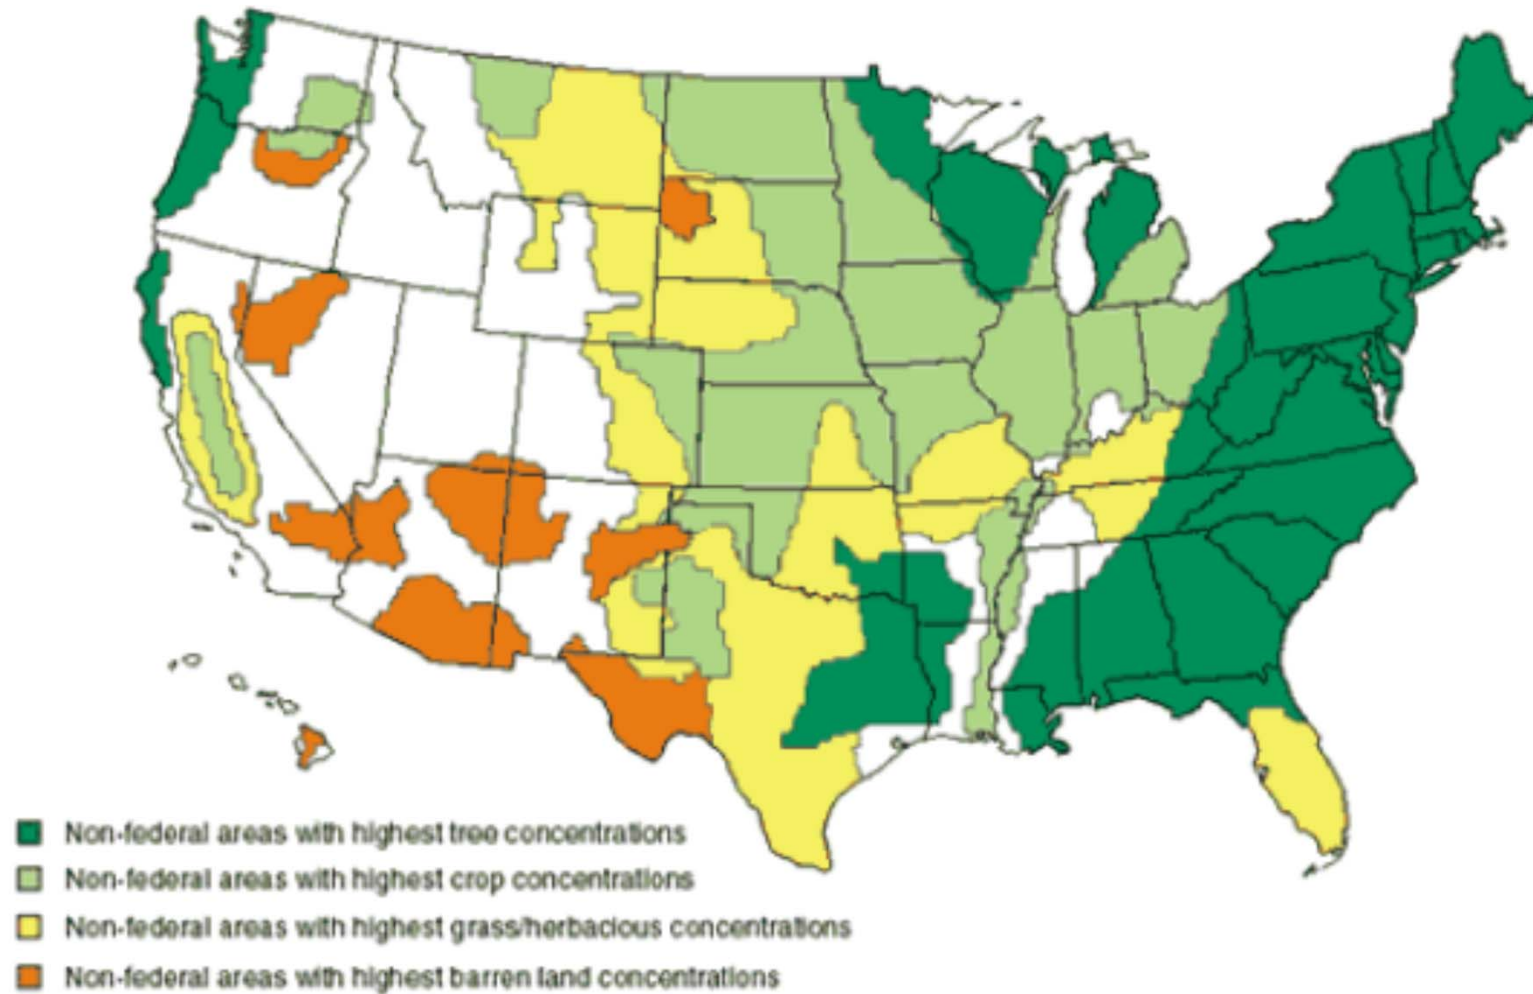

# Technical Challenges -- Geothermal Resources

## Low Temperature Geothermal Resources

## Highest Concentrations of Biomass Resources

## **Conclusions**

### Opportunities

- Cost characteristics have improved
- Fossil resource prices are high and anticipated to remain high
- Considerable State and Federal Policy Support

### Challenges

- Technologies need to continue to develop cost efficiencies in the face of generous supports
- Regulatory uncertainty
- Financial and contracting issues
